

### **BMT CTN 1202 Process for distribution of extracted DNA**

Dr. Shahinaz Gadalla performed DNA extraction of samples collected at Day +90 from patients enrolled on BMT CTN 1202. Extracted DNA has been generously returned to the NMDP Biorepository to be leveraged by other investigators for future ancillary studies. A total of 2,926 samples were returned from 1,057 patients. However, the number of vials returned per patient varies, as does the concentration of DNA and sample volume contained in each vial. To this end, samples with the lowest amount of DNA meeting the study criteria will be distributed to the requesting investigator. If only one vial exists, or if the amount of DNA contained in a vial substantially exceeds the study's requirement, the investigator will be asked to return the unused portion to the Biorepository for use in future research.
